                                                                                                                                                                             The invention provides a rat heparin-induced CCN-like protein (HICP) protein. Agents that stimulate or inhibit HICP protein activity or expression, antibense HICP nucleic acid molecules and HICP antibodies, can be used to modulate cell-associated activity. HICP modulators can be used to treat disorders characterized by aberrant HICP protein activity or expression. Probes capable of hybridizing to HICP protein activity specific for HICP can be used to detect HICP activity in a biological sample. HICP can be used to treat disorders, such as a cardiovascular or fibrotic disorder, characterized by aberrant cell proliferation. The present sequence represents the coding sequence of rat HICP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GlyAlaGlyProGlyGlyHisGlyAlaValCysLeuLeuAspGluAspAspGlySerCys 100

Agents that stimulate or inhibit HICP protein activity or expression, antisense HICP mucleig acid molecules and HICP antibodies, can be used to modulate cell-associated activity. HICP modulators can be used to treat disorders characterized by aberrant HICP protein activity or expression. Probes capable of hybardiating to HICP mRNA or antibodies specific for HICP can be used to detect HICP activity in a biological sample. HICP can be used to treat disorders, such as a cardiovascular or fibrotic disorder, characterized by aberrant cell proliferation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               183
                                                                                                                                                                               protein. Agents that stimulate or inhibit HCCP protein activity or expression, antisense HICP nucleic acid molecules and HICP antibodies, can be used to modulate cell-associated activity. HICP modulators can be used to treat disorders characterized by aberrant HICP protein activity or expression. Probes capable of hybridizing to HICP mRNA or antibodies sample. HICP can be used to detect HICP activity in a biological sample. HICP can be used to treat disorders, such as a cardiovascular or fibrotic disorder, characterized by aberrant cell proliferation. The present sequence represents the coding sequence of rat HICP mature
                                                                                                                                                                                                                                                                                                                                                                                                                      43

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes Wnt-1 induced secreted polypeptides, WISP-1, 2 and 3. The novel WISP polypeptides, designated WISP-1, WISP-2 and WISP-3 have homology to connective tissue growth factor (CTGF).

Products from the present invention can be used to treat WISP-related disorders such as breast, ovarian, and colon cancer or melanoma. The products can be used to treat arteriosclerosis. The products can also be used to treat other diseases e.g. benign and malignant tumours, leukaemia and lymphold malignancies, neuronal, gilal, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal, and blastocoelic disorders, desmoplasia, fibrotic lesions, kidney disorders, bone-related disorders such as osteoporosis, trauma such as burns, inclaions, and other wounds, connective tissue disorders, catabolic states, testicular-related disorders, and inflammatory, angiogenic and immunologic disorders including arteriosclerosis. The products can also be used for detection and diagnosis especially of
                                                                                              243

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes Wnt-1 induced secreted polypeptides, WISP-1, 2 and 3. The novel WISP polypeptides, designated WISP-1, WISP-2 and WISP-1 have homology to connective tissue growth factor (TGF).

Products from the present invention can be used to treat WISP-related disorders such as breast, ovarian, and colon cancer or melanoma. The products can be used to treat arteriosclerosis. The products can also be used to treat other diseases e.g. benign and malignant tumours, lenkaemia and lymphoid malignancies, neuronal, glial, astrocytal, bypothalamic and other glandular, macrophagal, epithelial, stromal, and blastocoelic disorders, desmoplasia, fibrotic lesions, kidney disorders, skin disorders such as osteoporosis, trauma such as observed in the catabolic states, testicular-related disorders, and inflammatory, angiogenic and immunologic disorders including arteriosclerosis. The products can also be used for detection and diagnosis especially of individuals with neoplastic cell growth or proliferation. The products can be used to induce death in WISP-1, 2 or 3 overexpressing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δλ
                                                                                                                                                                                                                                                                       The present invention describes Wnt-1 induced secreted polypeptides, WISP-1, 2 and 3. The novel WISP polypeptides, designated WISP-1, WISP-2, AISP-1, 2 and WISP-3 have homology to connective tissue growth factor (CYGF).

Toducts from the present invention can be used to treat WISP-related disorders such as breast, ovarian, and colon cancer or melanoma. The products can be used to treat atteriosclerosis. The products can also be used to treat other diseases e.g. benign and malignant tumnurs, leukaemia and lymphoid malignancies, neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal, and blastocelic disorders, desmopolesis-related disorders, tissue-growth disorders, and other wounds, connective tissue disorders, catabolic states, testicular-related disorders, and inflammatory, angiogenic and immunologic disorders including arteriosclerosis. The products can also be used for detection and diagnosis especially of individuals with neoplastic cell growth or proliferation. The products can be used to induce death in WISP-1, 2 or 3 overexpressing

This sequence encodes the EGF-like homologue PRO261.

The invention relates to antibodies (Ab) that bind to any of the polypeptides (I) designated PRO187, PRO533; PRO214; PRO240; PRO211; PRO250; PRO261; PRO260 or EBAF-2. The Ab, or other agents that inhibit tumours; and (II) as diagnostic/prognostic reagents for detection or quantification of (I) in cells or tissues, by standard immunoassays, with overexpression being indicative of cancer. For therapeutic use, the Ab may be condigated to a toxin, chemotherapeutic agent or radioisotope. Genes expressing (I), many of which are growth factor homologues, are overexpressed in some cases of cancer.
                                                                                                                                                                                                                                                                                                   140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

crims sequence represents a human PRO261 nucleotide sequence. PRO261 is a growth factor. The invention relates to isolated antibodies which bind to cap polypeptide. The "PRO" polypeptides are encoded by genes which are over expressed in the genome of tumour cells. Vectors and host cells comprising the nucleic acid encoding the antibodies and nucleic acids encoding the production of the antibodies. The antibodies and nucleic acid encoding them are used for diagnosing a tumour in a mammal. The antibodies are used for inhibiting the growth of tumour cells and identifying compounds that inhibit a biological or immunological activity of and/or expression of a PRO187, PRO513, PRO514, PRO214, PRO211, PRO210, PRO211, PRO240, PRO211, PRO210, PRO210,

AAS AAS21244-AAS21518 encode for novel human secretory and transmembrane

PRO polypeptides. The PRO polypeptides are useful to detect other

PRO polypeptides, to Auk bloactive molecules to cells expressing

PRO polypeptides, to medulate biological activities of cells expressing

PRO polypeptides, and to detect the presence of mammallan lung, colon,

breast, prostate, rectal, cervical or liver tumours by comparing PRO

prolypeptide expression in a cell sample to that in a control sample.

CC polypeptide expression and expression or differentiation of chondrocytes, the proliferation or differentiation of chondrocytes, the proliferation or cartilage, the proliferation of inner ear utricular supporting cells or

game expression in pergyte cells, the release of proteoglycans from

cartilage, the proliferation of inner ear utricular supporting cells or

game expression in pergyte cells, the release of proteoglycans from

cartilage, the proliferation of endothelial cells some of

the PRO polypeptides may modulate glucose or free fatty acid uptake by

skeletal muscle cells or by adipocytes; or inhibit binding of Arpeptide

to factor VIIA. The PRO polypeptides can be used in assays to identify

molecules involved in binding interactions. The polynocleotides encoding

PRO polypeptides can be used to generate probes, antisense smooding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bloactive molecules to cells expressing PRO polypeptides, and detect the presence of mammallan tumours e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to PRO proteins and coding sequences. The present sequence is the coding sequence for one such PRO protein. It was found that the PRO genes are amplified in the genome of tumour cells. The gene amplification is expected to be associated with the overexpression of the gene product and contributes to tumourigenesis. Therefore, antagonists of PRO proteins are useful for the treatment of benign or malignant tumours, leuksemias, lymphoid malignancies and other disorders such as neuronal, allal, astrocytal, hypothalamic, glandular, epithelial, inflammatory and immunologic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MetArgGlySerProLeuIleHisLeuLeuAlaThrSerPheLeuCysLeuLeuSerMet

The invention relates to novel human angiogenesis-associated proteins designated PRO protein's (AAB53064-B53097), and to nucleic acids encoding PRO protein's The invention also relates to vectors and host cells comprising a PRO nucleid acid, the recombinant production of a PRO protein, and comprising a PRO nucleid acid, the recombinant production of a PRO protein, and comprising a PRO protein, or antegonists of a PRO protein, and compounds which inhibit the expression of a PRO game. The invention additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosing a cardiovascular, endothalial or angiogenic disorder or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothalial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or PRO nucleic acid; and methods of inhibiting or stimulating endothalial componities and protein and methods of inhibiting or stimulating endothalial componities and protein and methods of inhibiting or stimulating endothalial componities and proteins, antibodies against thereof.

PRO nucleic acids, and methods of inhibiting or stimulating endothalial contains and methods of inhibiting or stimulating endothalial contains, antibodies against thereof.

PRO nucleic acids, proferine, antibodies against thereof.

Conditionals and profering any posteins, antibodies against thereof.

Conditionals, and profession of a PRO protein, and accomponity useful in the recombinant production of a production and activities. Crohn's disease, huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, to analyse genetic disorders, and in gene encoding PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids are about severuled acids. The invention of the inpersource represents a cobnection of the inpersource of the propertion of the inperson
                                                                                                                                            New isolated nucleic acid for producing a PRO polypeptide, analyzing genetic disorders and treating cardiovascular, endothelial or angiogenic disorders, "such as atherosclerosis, wounds or cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C; 390 G; 242 T; 0 other;

                                                                                          This nucleotide sequence codes for human connective tissue growth factor superfamily. It was discovered in a cDNA library derived from human osteoblasts. The gene has also been identified in cDNA libraries from ovary, testis, heart, lung, skeletal muscle, adrenal medulla, adrenal cortex, thymus, prostate, small intestine and colon. A cDNA clone is deposited as ATCC 97756. Also provided are vectors, host calls and recombinant methods for producing are vectors, host calls and recombinant methods for producing cTGF-3 polypeptides. CTGF-3 nucleic acid sequences or their fragments, e.g. primers or probes, can be used to diagnose diseases where CTGF-3 expression is enhanced, e.g. cancer, arthritis, ibrosis or atherosclerosis, or diseases where expression is decreased such as in osteoporosis. Disorders characterised by decreased or increased levels of CTGF-3 can be treated by administering CTGF-3 polypeptides and anti-CTGF-3 antibodies,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CysArgCysAspAspGlyGlyPheThrCysLeuProLeuCysSerGluAspValArgLeu

New isolated Wnt-1 induced secreted polypeptides, WISP-1, 2 and 3	3 A	181
Example 4; Page 174-175; 284pp; English.	QQ	562 TTT
The present invention describes Wnt-1 induced secreted polypeptides, WISD-1, 2 and 3 The novel wISD not non-tides destructed with a with the novel	Qy	201
and WISP-3 have homology to connective tissue growth factor (CTGF).  Profilets from the present invention can be used to treat without and the control of th	qq	622 TGG
disorders such as breast, ovarian, and colon cancer or melanoma. The products can be used to treat arteriosclerosis. The products can also be	Qy	221
used to treat other diseases e.g. benign and malignant tumours, leukaemia and lymphoid malignancies, neuronal, glial, astrocytal,	QQ	682 CGC
hypothalamic and other glandular, macrophagal, epithelial, stromal, and blastocoelic disorders, haematopolesis related disorders, tissue-growth disperders eth disorders assemblasis.	δ d	241
disorders, bone-related disorders such as osteoporosis, trauma such as burns, incisions, and other wounds, connective tissue disorders, catabolic states, testicular-related disorders, and inflammatory, and immunologic disorders including arteriosclerosis. The products can also be used for detection and diagnosis especially of individuals with neoplastic cell growth or proliferation. The inhibitor agent, i.e. a protease. The inhibitor agent, i.e. a protease. The inhibitor i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PDGF), fibroblast growth factor (FGF), connective tissue derived growth factor (CGF), connectived growth factor (KGF), transforming growth factor (KGF), transforming growth factor (KGF), wascular endothelial growth factor (KGF), wascular endotelial growth factor (KGF), wascular endothelial growth factor (KGF), wascular endothelial growth factor (KGF), wascular endothelial growth
                                                                                                                          platelet-derived growth factor; poge; fibroblast growth factor; FGF; connective tissue derived growth factor; CTGF; chrysalin; VEGF; keratinocyte-derived growth factor; KGF; epidermal growth factor; EGF; transforming growth factor-beta; TGF-beta; matrix metalloproteinase; MMP; granulocyte macrophage colony stimulating factor; GM-CSF; uPA; vascular endothelial growth factor; urokinase plasminogen activator; dermal ulcer; wound; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for the treatment of damaged tissue i.e. chronic wounds and dermal ulcers comprises an inhibitor agent i.e. a protease and a growth
                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= a //tag= a //product= "connective tissue derived growth factor related protein"

The invention provides novel human secreted proteins and polynucleotides encoding them. The secreted proteins can be expressed by standard recombinant methodology. The secreted proteins and polynucleotides are used to prevent, treat or ameliorate a medical condition in e.g. humans, also be used in diagnosting a pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme treated include autoimmune diseases e.g. rheumatoid arthritis, there is treated include autoimmune diseases e.g. rheumatoid arthritis, or eraptoraliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infections caused by bacteria, viruses and fungi and coular disorders e.g. corneal infection. The polypeptides can also be used as used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, chemotaxis. The polypeptides can also be used as a food additive or represents a human secreted protein encoding cDNA.
                                                                                                                                                                                    Birse CE, Soppet DR, Olsen HS;
